List of Figures

Chapter 1

Chapter Title Here

Welcome to the tutorial on how to use this thesis model. This is not to teach you how to use LaTeX. For that read a tutorial. But this aims to teach you how to do the basic stuff you will need in order to produce a decent document. We can start with a section and a section epigraph:

1.1 Citations

> *Python is a truly wonderful language. When somebody comes up with a good idea it takes about 1 minute and five lines to program something that almost does what you want. Then it takes only an hour to extend the script to 300 lines, after which it still does almost what you want.*
>
> DR. JACK JANSEN, MAINTAINER OF MACPYTHON

You can add extra info to you references, like [1, section 3]. You can also call them by author, like saying Fienup [1] .

You can make personal notes like this

Also a random displayquote thing:

> How can we image an object that's behind or enclosed on a medium where light does not propagate trivially? How can we manipulate light propagating in these media?

1.2 Figures

Let us start with a figure with two subfigures like in 1.1.

Or two figures side by side like 1.2 and 1.3.

(A) FCUP's fat cat doing what cats do.

(B) FCUP's fat cat resting.

FIGURE 1.1: FCUP's fat cat.

FIGURE 1.2: FCUP's fat cat doing what cats do.

FIGURE 1.3: FCUP's fat cat.

Or a figure with some text on the side, like 1.4, or even a figure wrapped around in text, as seen on Figure 1.5.

And here we have some text related to this image. The text can occupy the same space as the image would normally do.
FIGURE 1.4: FCUP's fat cat.

This is where the float goes with text wrapping around it. You may embed tabular environment inside wraptable environment and customize as you like: Ultrices dui sapien eget mi proin sed libero. Ornare lectus sit amet est placerat in egestas erat imperdiet. Tortor dignissim convallis aenean et. Quam adipiscing vitae proin sagittis nisl rhoncus mattis. Vivamus at augue eget arcu dictum varius duis. Cursus turpis massa tincidunt dui. Leo in vitae turpis massa sed. Tempor orci eu lobortis elementum. Turpis
egestas integer eget aliquet nibh prae-
sent tristique magna. Sed blandit libero
volutpat sed cras ornare arcu dui. Feu-
giat sed lectus vestibulum mattis ul-
lamcorper velit sed ullamcorper. In-
terdum velit euismod in pellentesque
massa placerat duis ultricies lacus. Ac ut consequat semper viverra nam. Dis parturi-
ent montes nascetur ridiculus mus. Mattis pellentesque id nibh tortor.

1.2.1 SVGs

How to make a LaTeX document with vector images, where the text in the images has
exactly the same font and size as in normal text? This article describes how this is done
using the 'PDF/EPS/PS + LaTeX' output feature of Inkscape 0.48. Inkscape can export
the graphics to PDF/EPS/PS, and the text to a LaTeX file. When the LaTeX file is input
in the LaTeX document, the PDF/EPS/PS image is included with overlaid text. Because
typesetting of the text is done by LaTeX, LaTeX commands can be used in images, such as
writing equations, references and shorthand macros.

(requires Inkscape version 0.48 or higher; this document discusses features up to Inkscape 0.49)

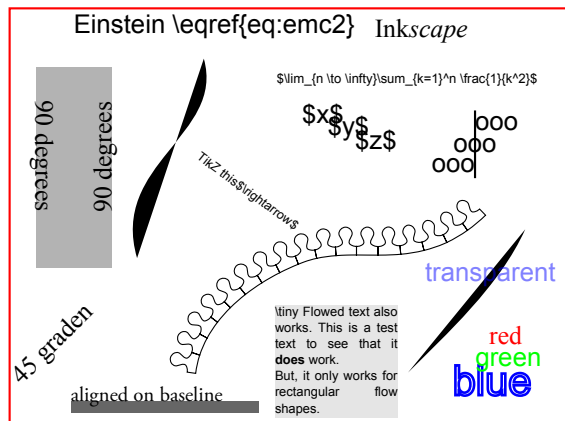

FIGURE 1.6: The test SVG image, as it is seen in Inkscape (exported to PDF *without* LaTeX
option).

$$E = mc^2 \tag{1.1}$$

FIGURE 1.7: The test image, exported to PDF *with* LaTeX option.

1.2.1.1 Automatic export

('write18' must be enabled, see the `epstopdf` package documentation. Add `-shell-escape` to the command line when calling `pdflatex`. And inkscape must be discoverable by the OS),

Whenever the SVG file is updated, it is possible to have LaTeX automatically call Inkscape to export the image to PDF and LaTeX again. This simplifies the workflow to

- Modify the SVG image in Inkscape;

- Save the SVG (Ctrl+S, no need to export to PDF);

- Recompile LaTeX document. pdfLaTeX will notice the SVG file has changed, and will automatically do the export for you.

1.3 Math

The following equation uses a custom mathematical operator defined in line 88 of preamble.tex:

$$\underset{x_1, x_2}{\text{meshgrid}} \mathbf{x}_1 = \begin{bmatrix} a_1 & b_1 & c_1 \\ a_1 & b_1 & c_1 \end{bmatrix}$$
$$\underset{x_1, x_2}{\text{meshgrid}} \mathbf{x}_2 = \begin{bmatrix} a_2 & a_2 & a_2 \\ b_2 & b_2 & b_2 \end{bmatrix} \tag{1.2}$$

The following equation uses the custom ceil and floor operator defined in line 86 of the stock preamble.tex:

$$x = \left\lfloor \frac{y}{2} \right\rfloor + \left\lceil \frac{w}{2} \right\rceil \tag{1.3}$$

And this is an equation with multiple lines:

$$I_0 = I' + I'' \cos(\Psi)$$
$$I_{\pi/2} = -I'' \sin(\Psi)$$
$$I_\pi = I' - I'' \cos(\Psi)$$
$$I_{3\pi/2} = I'' \sin(\Psi) \tag{1.4}$$

And this is some random Python code:

```python
def Hello():
    """

    Meaningful docstring with in-depth explanation of this function
    """

    print(''Hello World !!'')

if __name__ == '__main__':
    Hello()
```
